

## Claims

[c1] The above invention because of its natural reaction to game animal blood, will aid in the visual identification of hidden or misread signs from a wounded game animal.

[c2] The reaction of 4% hydrogen peroxide solution will transform the original blood spot to a "White"snow like substance. In addition this reaction increases the size of the original blood spot up to 3 to 4 times its original size. (The size of the blood spot after application will be dependent on its freshness)

renumber  
~~[c3]~~

c3 ~~[c4]~~ *In any event it will be clearly larger than the original blood spot and because of its "white" appearance, will be clearly disassociated from the typical green to brown and in some cases red-ish appearing environment. Thus elevating the odds of finding a wounded game animal that is leaving these nearly invisible and undistinguishable trace amounts of spotting blood.*
